

ODM 3.0.0 - minimal ERD for SQL database

Cardinality and ordinality (optionality)

Cardinality refers to the maximum number of times an instance in one entity can relate to instances of another entity. Ordinality, on the other hand, is the minimum number of times an instance in one entity can be associated with an instance in the related entity. Cardinality and ordinality are shown by the styling of a line and its endpoint, according to the chosen notation style.

- **Program description tables (yellow tables)** store administrative information about the organizations involved in testing, locations where tests were conducted, protocols used etc.
- **Dictionary look-up tables (green tables)** are reference tables to support reporting measures and samples. The tables are used when new measures are created or added to the ODM to describe how to report a new type of sample or measure.
- **Results tables (blue tables)** store information about samples and the results of tests performed on the samples.
- **Bolded entries** in a table indicate that they are mandatory. For example, in the "protocols" table, "protocolID" is mandatory. Note that some of these entries are only mandatory under certain conditions, please refer to the "parts" table or the documentation for further information.
